The cylinder head 4 may be either plain or as shown. That shown is constructed to receive an automatic slack-adjuster which is sometimes used with the automatic system. When an application is made, air enters behind the piston and forces it outward, compressing the release spring 5. When the air is exhausted from the cylinder, the release spring 5 pushes the piston back to its normal position. Cylinder head 6 is constructed so as to provide a place for the coil spring when the piston is forced outward. The size of the cylinder depends on ---, 1 the design of the brake rigging and ill on the weight of the car. The sizes cpmmonly used are 8, 10, and 12 inches in diameter. i Operating Valve. The purpose and operation of the operating valve have already been described as well as the four positions...
